CAD & DRAWING In the early days of CAD, users used only the simplest tools to create drawings. Most CAD operators had little or no drawing experience. They were typically computer science majors with minimal or no training in drafting. The first CAD programs were very similar to the layout programs available on mainframe computers. For example, an early commercial CAD product called QCAD was similar to IBM's popular Mark II drawing program for the IBM 704, available in 1972. QCAD 3.9, circa 1972, running on an IBM 704 computer. You can see the drafting tools in the lower left-hand corner of the screen. When CAD programs first appeared in the early 1980s, they were sold mainly to engineering firms, construction companies, and architects. In those days, the only affordable way to create detailed drawings was to create them on a graphics terminal. The machine operators created sketches or storyboards, then called engineers or draftsmen to work with them at the graphics terminal. The new "on-screen" CAD programs made it possible to create drawings in the office. It also made CAD tools affordable for a broader range of users. By the early 1980s, it was clear that CAD had the potential to transform the design process.

CAD PROGRAMS Computer-aided design programs can be categorized by their construction. There are two types of CAD programs: general-purpose and specialty. General-purpose CAD programs can be used to create engineering, architectural, and construction drawings. These are the most popular CAD programs. AutoCAD and ArchiCAD are two examples. They're general-purpose CAD programs, with a variety of functions. The ArchiCAD application shown here has a sophisticated drawing package, including a parametric feature. The video shows the Arch

Since the beginning of time, people have been wondering: how is it possible to make an infinite stairway of boxes or just a building? Probably they have something that they just don't know, something that will work a lot faster and easier than anything that we have at the moment. TODO: What about the material issue? Is there a material that will act as mortar and not spoil after each step? It would be great if you could make a door that only needs to be closed for a couple of seconds to make a step. I don't know what that material could be. Maybe we could build something like in the image below or even a complete stairway made of a solid and narrow shape. A complete box that isn't useful, but to make a stairway or another thing that's not useful. This is the structure that I imagined: A box with a hole for each step, and maybe a special adhesive that will seal them, so they won't open from outside. I just made a step in my art house.
